

Session 4

1. Create a simple JavaScript function called `calculateTotal` that takes two numbers: `itemPrice` and `quantity`, and returns the total bill amount using arithmetic operators.

```
#include <stdio.h>
```

```
float calculateTotal(float itemPrice, int quantity) {  
    return itemPrice * quantity;  
}
```

```
int main() {  
    float itemPrice = 500.0;  
    int quantity = 3;  
  
    float total = calculateTotal(itemPrice, quantity);  
  
    printf("Total Bill Amount: %.2f\n", total);  
  
    return 0;  
}
```

Session 4

2. Build a Flipkart-style discount calculator: given product price, discount percentage, and a boolean isMember, use arithmetic and logical operators to calculate the final price (apply an extra 5% off if isMember is true).
